The DNA sequence is that of the expression vector pmTNF-MPH which contains the tetracycline resistance gene and origin of replication of pATIS3, the lambda PL promoter up to the MboII site in the N gene 5' untranslated region, followed by a synthetic ribosome binding site and the information encoding the first 25 amino acids of mouse TNF. This sequence is followed by a synthetic polylinker encoding six consecutive histidines followed by several proceolytic sites each accessible via a different restriction enzyme which is unique for the plasmid. Downstream from the polylinker, several transcription terminators are present, including the E. coll trp terminator. The DNA encoding a fragment of the including the E. coll trp terminator. The DNA encoding a fragment of the skpression vector to express the fusion protein mTNF-H6-p362. The

                                                          The plasmid is used to clone and express. The polypeptide induced in macrophages by lipopolysaccharide stimulates cell prolification (esp. when costimulated with IL-4) promote activation, cytotoxicity, and mobilisation of LAK cells; promote recruitment of suppressive peritoneal exudate cells; promote generation of immunocompetent lymph node cells (ILC) and have trypanocidal and trypanolytic activity. The human and murine sequences are given in (AAQS1431-45), peptide fragments able to generate antibodies are given in (AARS1951-61) (Updated on 25-MAR-2003 to

The present invention relates to a method of predicting the evolutionary potential of a mutant resistance gene. The method comprises providing a host cell which includes a mutant resistance gene and determining whether the mutant resistance gene is likely to evolve through two or more and the encoded mutant resistance-conferring polypeptides, and a method of screening a drug for anti-pathogenic activity against a pathogen and assessing the potential longevity of a candidate anti-pathogenic drug. The mutant resistance gene includes two or more nucleic acid assessing the potential longevity of a candidate anti-pathogenic drug. The mutant resistance gene is inserted into a host cell cusing a plasmid and treating the host cell to incorporate the plasmid into the host cell. The method is useful for predicting the evolutionary potential of a mutant resistance gene. The mutant resistance genes are cusful for screening for a drug for anti-pathogenic activity against a pathogen. The present sequence represents a plasmid construct used in the method of the invention.
                                                                                              Predicting the evolutionary potential of a mutant resistance gene, useful for screening for anti-pathogenic drugs comprises determining if a mutant resistance gene is likely to evolve through two or more independent mutation events.
                                                                                                                                                                                                                                Disclosure; SEQ ID NO 1; 47pp; English

The plasmid includes an origin of replication sequence, denoted p15A ori, positioned within an ExoRT-HindITI fragment corresponding to nucleotides 1-1523 of the present invention is based on the finding that the present sequence. The present invention is based on the finding that key mutations in the p15A ori sequence operatively linked within a copy number plasmid being converted from a low copy number to a high copy number plasmid useful for more efficient cloning, DNA and RNA purification, protein expression and co-expression. The mutated copy plasmids other than pACYC184 to convert them to high copy plasmids. The referred mutations to p15A ori were identified following random copy from the pack product to 5A locus of pACYC184 by PCR, use of an amplified 1.5 kb product to 5A locus of pACYC184 by PCR, use of an amplified 1.5 kb product to 5A locus of pACYC184 by PCR, use of an amplified 1.5 kb product to 5A locus of pACYC184 by PCR, use of an experience of 18L21(DE3) cells and screening of transformation of Escherichia coli BL21(DE3) cells and screening of transformation that of pACYC184. Sequencing of the ECORI HindIII fragment of pECI-073 as the native
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1553
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1448
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1508

This GSS is part of a random genomic sequencing program of thirteen
yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces
exiguus, Saccharomyces servazzii, Zygosaccharomyces rouxii,
Saccharomyces kluyveri, Kluyveromyces thermotolerans, Kluyveromyces
lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia
angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila,
Candida troplicalis and Yarrowia lipolytica. Genomic inserts of 3 to
5 kb were prepared and both extremities were sequenced. See
keywords for description of this sequence and for the sequence of
the other extremity of this insert.

/note="Organ: leaf; Vector: RescueMu (engineered from pBlueScript backbone); Site 1: BamHI; Site 2: BglII;
RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription
units. For more information on RescueMu, go to the web
site 'www.zmdb.iastate.edu' and follow the links for 'RescueMu.' Grid S was grown at San Diego in 2002. DNA was extracted from leaf strips, double digested using BamHI and BglII, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1825

Kohara, Y. and Okada, N.
Extensive analysis of ORF sequences from two different cichlid
species in Lake Victoria provides molecular evidence for a recent
radiation event of the Victoria species flock: identity of EST
sequences between Haplochromis chilotes and Haplochromis sp.
